

Mini Project using HTML, CSS, Bootstrap and JavaScript

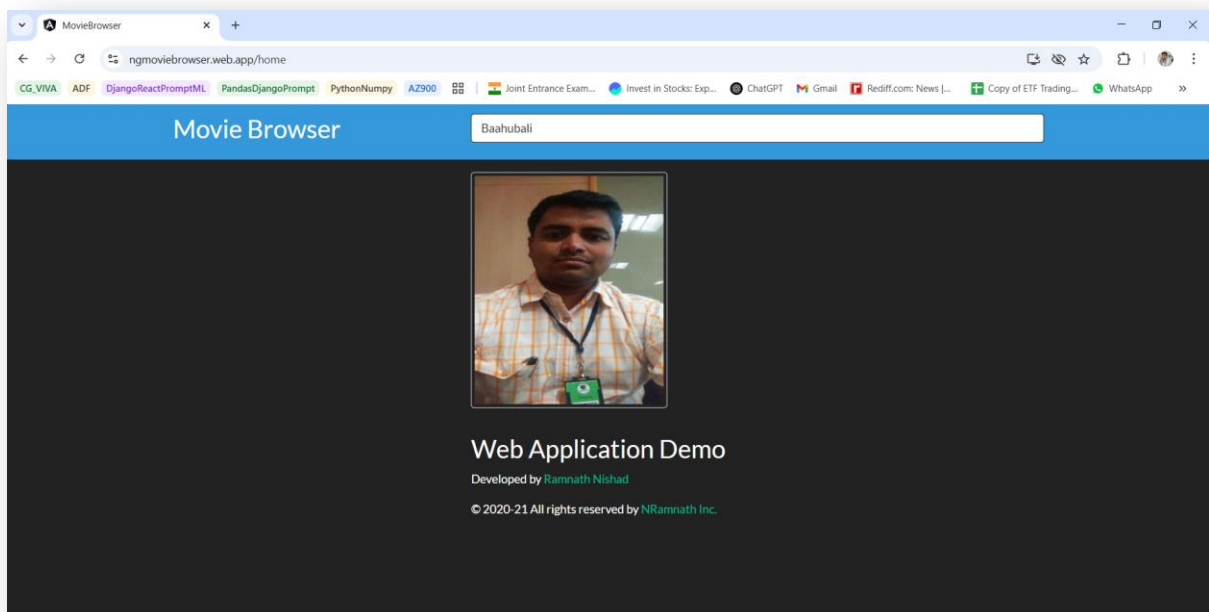

Design a Website **Movie Browser** used for searching Movies by some movie title.

Store some sample list of movies in web storage when Home page is loaded with following fields:

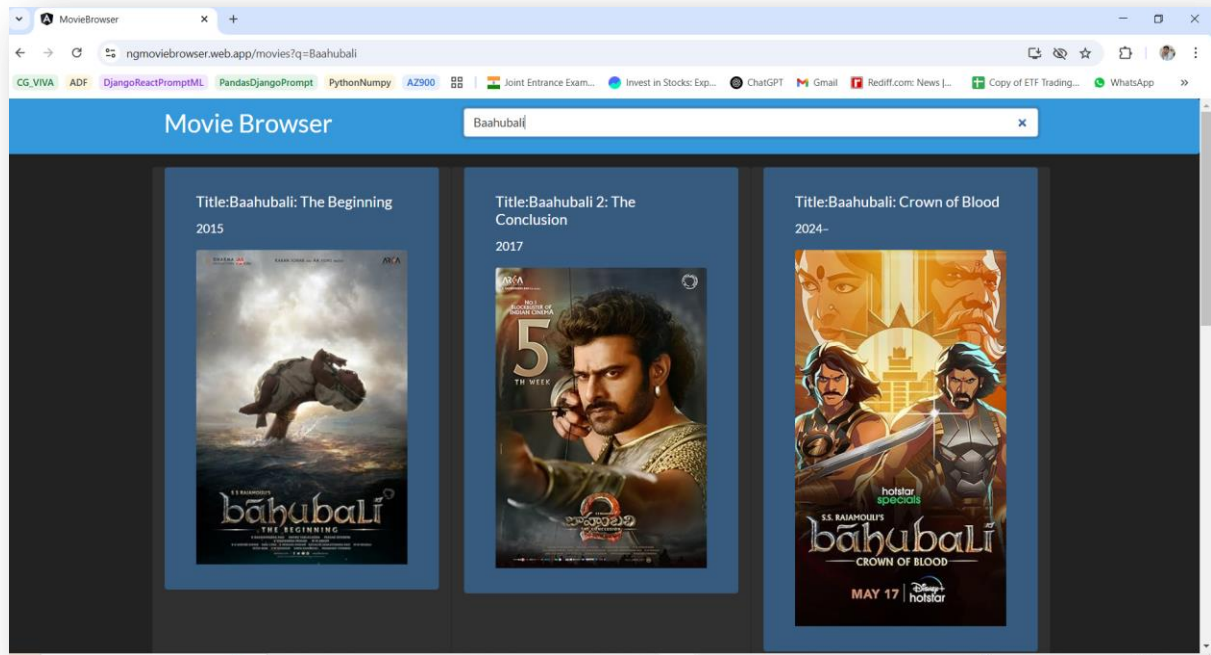

- **Movie id**
- **Movie Title**
- **Director**
- **Plot->small summary about the story**
- **Year-> year of release**
- **Genre ->multiple values like Action, Drama,....**
- **Boxoffice-> box office collection total**
- **Actors->multiple values like actor1, actor2, ..**
- **ImageUrl**

Keep the images files for each picture in the folder.

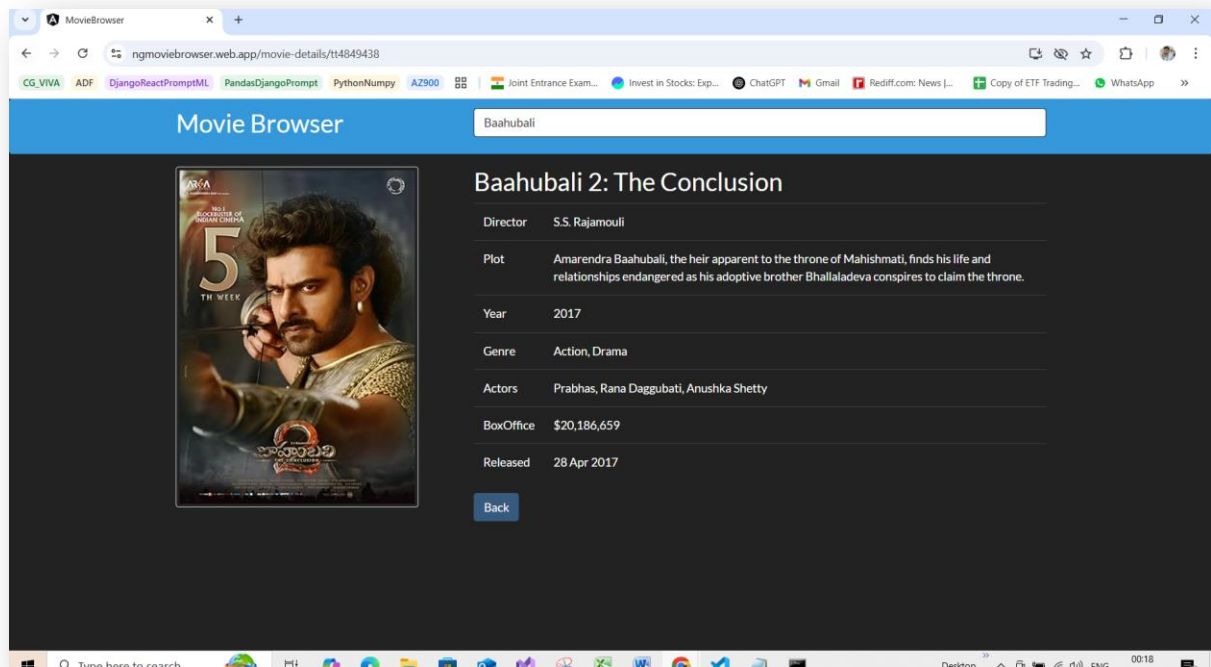

1. Home page should display “**Movie Browser**” heading, a search box and author introduction with picture as below:

2. Once user hit enter key after typing words from movie title, it should display the list of movies found in the same page below as shown below:

3. User can click the heading “**Movie Browser**” anytime to go back to the Home page.
4. Once user clicks the particular found movie image, it should display the details of the movie in the same page below as shown below:

5. Clicking “Back” button should go back to home page.
